

C PROGRAMMING ON LINUX (P1)

1. Creating - Editing - Running a C file

Step 1. Create a C file

- Using a text editor like vim, nano or gedit.
- Example: `vim scriptname.c`
- A C file with the name `myscript.c` is created.

Step 2. Write script

- Coding to solve the problem.
- Save and exit the editor:
 - `nano`: Press `CTRL + X`, then `Y`, and `Enter`.
 - `vim`: Press `ESC`, type `:wq`, and press `Enter`.

Step 3. Compiling a C program

- Use the `gcc` compiler to compile your program:
- Using command: `gcc scriptname.c -o scriptname`
- If you just command `gcc scriptname.c`, the system auto generates the output file is `a.out`, then you can use it to run.

Step 4. Run the script

- Using command: `./scriptname`
- If executed correctly, it will return the result in the terminal.
